

ABSTRACT OF THE DISCLOSURE

A device for producing an opening or cavity in the side
of a ceramic product during product molding in a mould
with a molding cavity delimited by a molding surface
which has a window, comprising a deformable punch,
5 joined on the window, designed to project into or
retract from the molding cavity, with the ability to
vary its rigidity. The device comprises punch shape
variation differential constriction means and actuator
means for punch deformation, which together produce a
10 controlled anisotropic punch deformation, which makes
the punch project into the molding cavity. [Figure 1]
